

B44.2

Factory Team

#9062 RC10B44.2 Factory Team Kit

1:10 Scale Electric 4WD Off Road Competition Buggy Kit Manual & Catalog ^{2/13}

TEAM ASSOCIATED

Designed in California, USA

:: Introduction

Thank you for purchasing this Team Associated product. This assembly manual contains instructions and tips for building and maintaining your new RC10 B44.2. Please take a moment to read through this manual to help familiarize yourself with these steps.

We are continually changing and improving our designs; therefore, actual parts may appear slightly different than in the illustrations. New parts will be noted on supplementary sheets located in the appropriate parts bags. Check each bag for these sheets before you start to build.

:: KIT Features

The B44 platform has had a long and very successful legacy winning several IFMAR Worlds titles and races all over the world. The B44.2 is the latest in B44 refinement with improved jumping and cornering handling characteristics as well as overall durability. The B44.2 features new 12mm shocks with concentricity building cartridge hat bushings, captured with an aluminum cap for the smoothest and most consistent strokes. The 12mm shocks also feature new Factory Team high precision 12mm springs, which are black-oxide coated to prevent rusting without affecting tolerances. The new battery cradle allows for battery placement adjustment to fine tune weight distribution, and allowing for quick and easy battery changes with the new strap design. The center divider of the battery cradle can be replaced with an optional (not included) ballast weight for more rearward weight bias. Motor installation and adjustment is a breeze thanks to the cam motor mount system. To make the drivetrain more robust the VTS slipper was implemented to provide better adjustment resolution and consistency, while the new 12mm rear clamping hexes aide in putting down the power through the new 12mm hex wheels. The blue aluminum rear hubs add durability and optional camber link adjustment options. Lastly, the B44.2 comes with the latest JConcepts +8mm Finisher body and FT protective chassis sheet.

Features in the B44.2 Factory Team:

- Chassis is lengthened 8mm and narrower by 3mm utilizing 2.5mm carbon fiber chassis for LiPo saddle packs only.
- New molded battery tray allows for forward/ back battery position adjustment with molded battery spacer.
- Updated 3.5 mm front shock tower and 3.0mm rear shock tower with clearance for 12mm shocks and an additional inside shock mount location.
- Updated front arm with reinforcement rib.
- Updated front top deck for more durability and rigidity along with a locking antenna mount.
- Machined 7075-T6 aluminum Cam motor mount set.
- Factory Team 0 degree 7075-T6 aluminum rear hubs with oversize outer bearing.
- FT 12mm anodized shock bodies and threaded collars, with concentric hat bushing cartridge and machined aluminum cap.
- VTS slipper assembly with high-rate spring.
- JConcepts +8mm Finisher body.
- FT protective chassis sheet.
- Rear anti-roll bar included.
- Hard anodized aluminum shock caps with bleed screws.
- TiN "Gold" 3mm shock shafts front and rear.
- Molded pivoting quick change battery straps with locking thumb knobs.
- FT 12mm aluminum rear clamping hexes and 12mm hex rear wheels.

:: Additional Features

B44.2 FT. Additional Kit Features:

- Ball differentials with Carbide diff balls and light-weight outdrives
- CVA joints with pin retainer clips
- Factory Team blue aluminum servo mounts
- Factory Team blue aluminum shock pivot balls
- Fully adjustable camber, and toe-in
- Vertical ball end adjustment front & rear
- Dual-sided externally adjustable slipper clutch
- Factory Team blue Titanium turnbuckles
- Factory Team blue aluminum shock bushings
- Ball-bearings steering bell cranks
- Built in servo saver

:: Other Helpful Items

- Silicone Shock Fluid (Refer to catalog for complete listings)
- Body Scissors (AE Part # 1737)
- FT Hex Wrenches (AE Part # 1655)
- Soldering Iron
- Reamer / Hole Punch
- Needle Nose Pliers
- Calipers or a Precision Ruler
- Wire Cutters
- Multi Tool (AE Part #7494)
- Green Slime shock lube (AE Part # 1105)
- Hobby Knife

:: Notes

This symbol indicates a special note or instruction in the manual.

There is a 1:1 hardware foldout page in the back of the manual. To check the size of a part, line up your hardware with the correct drawing until you find the exact size. Each part in the foldout has a number assigned to it for ordering replacement parts.

shock cap

Shock Bleeding Steps:

1. Before assembly, get each bleed screw and thread it 1-2 turns into the shock cap. This will make installation easier when you are bleeding your shocks.
2. Pull shock shaft down.
3. Fill shock body 3/4 full with silicone shock fluid.
4. Slowly move the shock shaft up and down to remove air from under the piston.
5. Wait for bubbles to come to surface.
6. Fill shock body to top with silicone shock fluid.
7. Place a drop of oil in the cap and on cap threads.
8. Install cap (without bleed screw) and tighten completely.
9. Slowly compress shaft all the way to bleed excess silicone shock fluid out the hole in the cap (use rag around shock to catch excess fluid).
10. Install M2x4mm button head screw until snug while shaft is fully compressed.

Painting Tips:

Body :

Your B44.2 FT comes with a clear polycarbonate body. You will need to prep the body before you can paint it. Wash the inside thoroughly with warm water and liquid detergent. Dry the body using a clean, soft, lint-free cloth. Use the supplied window masks to cover the windows from the **INSIDE** of the body (RC cars get painted from the inside).

Using high quality masking tape, apply tape to the inside of the body to create a design. Spray (either rattle can or airbrush) the paint to the inside of the body (preferably dark colors first, lighter colors last).

NOTE: use **ONLY** paint that is recommended for use with (polycarbonate) plastics. If you don't, you can destroy the plastic body!!!!).

After painting, cut the body along the trim lines. Make sure to drill or use a body reamer to make the holes for the body mounts and antenna!

* Not all servo's are listed

* Make sure servo linkage clears the servo through full travel in both directions.
Use #7336 servo spacers to adjust the servos position

:: Tuning Tips

Tips for Beginners:

Before making any changes to the standard setup, make sure you can get around the track without crashing. Changes to your vehicle will not be beneficial if you can't stay on the track. Your goal is consistent laps.

Once you can get around the track consistently, start tuning your vehicle. Make only ONE adjustment at a time, testing it before making another change. If the result of your adjustment is a faster lap, mark the change on the included setup sheet (make additional copies of the sheet before writing on it). If your adjustment results in a slower lap, revert back to the previous setup and try another change.

When you are satisfied with your vehicle, fill in the setup sheet thoroughly and file it away. Use this as a guide for future track days or conditions.

Differential:

Adjust the differential (A.K.A. 'diff' for short) as noted in the assembly instructions. Adjusting the rear diff is not meant to be a tuning option. If you can hear the diff making a "barking" or "chirping" sound on jump landings or under acceleration, either your diff is set too loose or your slipper clutch is set too tight. The front diff can go out 1/16" turn to get more steering.

Slipper Clutch:

The assembly instructions give you a base setting for your clutch. To preserve the differentials, always start with the slipper on the loose side and slowly tighten the adjustment nut until it is set. To adjust the slipper, remove the body and insert a 2mm (or 5/64") hex wrench through the center of the top deck (or through the bottom slot in the chassis). Then, grab both of the rear wheels and rotate forwards to tighten and backwards to loosen. As you spin the wheels, you'll feel the motor click every 1/4 of a wheel revolution. At the track, tighten or loosen the nut in 2 click increments until you hear only a faint slipping sound for 1-2 feet on takeoffs.

Front Camber Link Length & Washers Under Ballstud:

Changing the length of the camber link is considered a bigger step than adjusting the ballstud height. Typically shortening the camber link (or lowering the ballstud) will give the front end less roll and quicken steering response. Lengthening the camber link (or raising the ballstud) will give the front more roll and slower steering response. To raise the ballstud, remove washers from between the ballstud and upper deck.

Front Camber:

A good starting camber setting is -1 degrees. Use the included #1719 camber gage to set your camber. Positive camber, where the top of the tire is leaning out, is typically not recommended.

Front Toe-In:

Zero degree toe-in (tires pointing straight forward) is the setting that should be used in almost all track conditions. Occasionally you can increase turn in by adding a little toe-out (front of tires point slightly out). Front toe in is not a typical tuning adjustment used by The Team.

Front Arm Hole:

The kit silver springs and outside front arm hole will work best in most cases. Moving the shock to the inside hole on the front arm requires you to add another down travel limiter to the front shocks, so there should be two down travel limiters in each shock. You should also change to a stiffer spring to account for the difference in leverage on the shock.

Front Ride Height:

The standard front ride height setting is 21 mm. Check the ride height by lifting up the entire car about 8-12 inches off the bench and drop it. After the suspension "settles" into place, raise or lower the shock collars as necessary until there is 21 mm gap from the bottom of the chassis to the ground.

Anti-Squat:

Anti-squat denotes the angle of the rear arms relative to the ground. Zero anti-squat means that the rear arms are flat, parallel with the ground. The kit setting is 2 degrees, and can be reduced to 1 degree by removing the included #4 washer underneath the arm mount. You can add another #4 washer so that there is two washers underneath the arm mount to get 3 degrees of anti-squat. Adding anti-squat tends to make the car "rotate" more in corners, but doesn't handle as well through the bumps. 1 degree will be better in bumpy sections.

Rear Camber Link Length & Washers under Ballstud:

Changing the length of the camber link is considered a bigger step than adjusting the ballstud height on the rear chassis brace. Typically shortening the camber link (or lowering the ballstud) will give the rear end less roll and the car will tend to accelerate or "square up" better. Lengthening the camber link (or raising the ballstud) will give the rear more roll and more cornering grip. To raise the ballstud, remove washers from in-between the ballstud and upper deck. You should normally use the kit setting and only adjust the ballstud height.

:: Tuning Tips (cont.)

Rear Hub Spacing:

You have 3 options for rear hub spacing, FORWARD, MIDDLE, & BACK. The kit setting is FORWARD, which provides the most rear traction and will be used most often. For improved handling in bumps or rhythm sections, try moving the hubs to MIDDLE or BACK. This can also make the car handle better in 180° turns.

Rear Anti-Roll Bar:

The #9780 B44 anti-roll bar kit (A.K.A. swaybar) allows you to add roll resistance to the rear end with minimal effect on handling over bumps and jumps. The anti-roll bar is very helpful when trying to tune the suspension. The black bar is the softest (.047" wire) and the silver (.055" wire) is the standard. It is popular to run a rear anti-roll bar in 4wd to help the car square up more out of turns.

Rear Arm Hole:

The inner hole in the arm tends to work the best over the bumps and jump sections. Changing to the outer hole in the rear arm will tend to make the rear end feel more "locked in" and less responsive. Making this change to the outer hole requires you to remove the downtravel limiters from the rear shocks.

Rear Ride Height:

The rear ride height setting you should use most often is 20 mm (the rear arms appear level when looking from the rear). Check the ride height by lifting up the entire car about 8-12 inches off the bench and drop it. After the suspension "settles" into place, raise or lower the shock collars as necessary until there is 20 mm gap from the bottom of the chassis to the ground. Note: Check the ride height gap at the rear end of the carbon fiber chassis, not at the rear chassis plate which is raised for more ground clearance. The chassis should look level from the side.

Battery Placement:

The B44.2 battery cradle allows for quick battery spacing adjustment to fine tune the front to back weight distribution as needed. A simple rule of thumb to follow is, if your car pushes through the corner, shift the battery back & if it oversteers in the corner, move the battery forward.

Ackerman:

"Ackerman" refers to the relative angle difference between the front wheels as they are turned to steer the car. More ackerman means that there is a greater difference in angle between the wheels, and the less ackerman you have the closer the wheels steer parallel to each other. The ackerman on the B44.2 can be adjusted by moving the steering rack ballstud forwards or back on the steering rack.

The steering ballstud in the back position on the rack (More Ackerman) will make the car more forgiving to drive, particularly in looser conditions.

The steering ballstud in the forward position on the rack (Less Ackerman) will make the car twitchier around center but will have more steering mid to corner exit.

Steering Rack:

Setup Sheets:

Most often, the best way to get your car handling right is to go to our website www.rc10.com and click on the links to Setup Sheets, then RC10B44.2 setups. Our team of professional drivers help develop these setups at National events. Also, most drivers have a "base" setup that they use as a starting point for every event. Try running some of our base setups OR look for track conditions and tires that are similar to your local track and mimic that setup. Remember, each adjustment has a purpose, so copy everything from the setup sheet and then make adjustments based on the recommendations in this manual.
