Factory Team

#9063 RC10B44.3 Factory Team Kit

1:10 Scale Electric 4WD Off Road Competition Buggy Kit Manual & Catalog

# TEAM ASSOCIATED

Designed in California, USA

## :: Introduction

Thank you for purchasing this Team Associated product. This assembly manual contains instructions and tips for building and maintaining your new RC10 B44.3. Please take a moment to read through this manual to help familiarize yourself with these steps.

We are continually changing and improving our designs; therefore, actual parts may appear slightly different than in the illustrations. New parts will be noted on supplementary sheets located in the appropriate parts bags. Check each bag for these sheets before you start to build.

## :: KIT Features

The RC10B44 has created a winning legacy with three I.F.M.A.R. World Championships, four R.O.A.R. National titles, and countless regional wins to its credit! Since winning the 2013 I.F.M.A.R. World Championships, the designers behind the doors of Area 51 set out to further improve the B44 and take it to an even higher level of performance.

Enter the RC10B44.3 Factory Team Kit, the latest evolution of Team Associated's 1:10 4WD electric off road competition buggy. The most significant changes are found on the new hard-anodized aluminum chassis, which helps lower the center of gravity to improve handling and durability. The chassis has been designed to have symmetrical torsional flex to improve handling consistency — the new floating motor mount, floating servo mount, and chassis machining help to provide the desired flex symmetry.

Power and traction have continued to improve, so the B44.3's drivetrain has been built up and refined to keep up with the demand of today's high-traction off-road tracks. A set of four precision CVA's transfer the power from the gear differentials via ball bearings throughout the car.

Now the B44.3 is even more adaptable to multiple racing conditions with the adjustable weight bias feature. Weight bias can be significantly altered by using either the front motor configuration with a saddle pack or the rear motor configuration with a shorty pack. The B44.3 is also backwards compatible with the previous generation VTS slipper clutch (not included) and ball differentials (not included), making the B44.3 extremely versatile and adaptable to any track condition.

Factory Team V2 12mm big bore shocks have improved smoothness, improving suspension travel and increasing overall traction. Lastly, the B44.3 comes with the latest JConcepts Finnisher X-Flow body and AE 6.5" high downforce wing.

The RC10B44.3 has been given all of the design advantages that only a winning pedigree like Team Associated can provide. If you are ready to take your 1:10 4WD off-road program up to the next level, the B44.3 is ready to take you there!

Features in the B44.3 Factory Team:

- Hard anodized aluminum chassis and 7075-T6 floating motor mount allows for front or rear motor configurations
- New molded battery trays accommodate 2S saddle or shorty battery pack configurations and feature a quick-change strap with locking thumb knobs
- New front and rear carbon-fiber top decks and floating servo mount improves symmetrical chassis flex
- Front and rear gear differentials have machined steel ring, pinion, and planetary gears
- Center gear differential has independent fluid cap for quick and easy fluid or gear changes
- JConcepts Finnisher X-flow body
- Factory Team 0° 7075-T6 aluminum rear hubs with oversize outer bearing
- Factory Team V2 12mm "Big Bore" threaded aluminum shocks with 3mm shock shafts, molded caps with bleed screws, and updated O-rings for improved smoothness
- Full CVAs and ball bearing drivetrain
- Factory Team 12mm blue aluminum rear clamping hexes and 12mm hex rear wheels
- Factory Team blue titanium turnbuckles, aluminum servo mounts, aluminum shock pivot balls and rear anti-roll bar included

## :: Other Helpful Items

.030

**1777**  
Shock  
eyelet

**1777**  
FT shock  
pivot ball

## :: Shocks Build - Bag M-MM - Step 3

### Shock Bleeding Steps:

1. Before assembly, get each bleed screw and thread it 1-2 turns into the shock cap. This will make installation easier when you are bleeding your shocks.
2. Pull shock shaft down completely.
3. Fill shock body 3/4 full with silicone shock fluid.
4. Slowly move the shock shaft up and down to remove air from under the piston.
5. Wait for bubbles to come to surface.
6. Fill shock body to top with silicone shock fluid.
7. Place a drop of oil in the cap and on cap threads.
8. Install cap (without bleed screw) and tighten completely.
9. Slowly compress shaft all the way to bleed excess silicone shock fluid out the hole in the cap (use rag around shock to catch excess fluid).
10. Install M2x4mm button head screw until snug while shaft is fully compressed.

**Step 9-10**

clips, blue**

### **Painting Tips:**

Body :

Your B44.3 FT comes with a clear polycarbonate body. You will need to prep the body before you can paint it. Wash the inside thoroughly with warm water and liquid detergent. Dry the body using a clean, soft, lint-free cloth. Use the supplied window masks to cover the windows from the INSIDE of the body (RC cars get painted from the inside).

Using high quality masking tape, apply tape to the inside of the body to create a design. Spray (either rattle can or airbrush) the paint to the inside of the body (preferably dark colors first, lighter colors last).

NOTE: use ONLY paint that is recommended for use with (polycarbonate) plastics. If you don't, you can destroy the plastic body!!!!).

After painting, cut the body along the trim lines. Make sure to drill or use a body reamer to make the holes for the body mounts and antenna!

## :: Notes

## :: Tuning Tips

### Tips for Beginners:

Before making any changes to the standard setup, make sure you can get around the track without crashing. Changes to your vehicle will not be beneficial if you can't stay on the track. Your goal is consistent laps.

Once you can get around the track consistently, start tuning your vehicle. Make only ONE adjustment at a time, testing it before making another change. If the result of your adjustment is a faster lap, mark the change on the included setup sheet (make additional copies of the sheet before writing on it). If your adjustment results in a slower lap, revert back to the previous setup and try another change.

When you are satisfied with your vehicle, fill in the setup sheet thoroughly and file it away. Use this as a guide for future track days or conditions.

### Front Camber Link Length & Washers Under Ballstud:

Changing the length of the camber link is considered a bigger step than adjusting the ballstud height. Typically shortening the camber link (or lowering the ballstud) will give the front end less roll and quicken steering response. Lengthening the camber link (or raising the ballstud) will give the front more roll and slower steering response. To raise the ballstud, remove washers from between the ballstud and upper deck.

### Front Camber:

A good starting camber setting is  $-1$  degrees. Use the included #1719 camber gage to set your camber. Positive camber, where the top of the tire is leaning out, is typically not recommended.

### Front Toe-In:

Zero degree toe-in (tires pointing straight forward) is the setting that should be used in almost all track conditions. Occasionally you can increase turn in by adding a little toe-out (front of tires point slightly out). Front toe in is not a typical tuning adjustment used by The Team.

### Front Arm Hole:

The kit silver springs and outside front arm hole will work best in most cases. Moving the shock to the inside hole on the front arm requires you to add another down travel limiter to the front shocks, so there should be two down travel limiters in each shock. You should also change to a stiffer spring to account for the difference in leverage on the shock.

### Front Ride Height:

The standard front ride height setting is 21 mm. Check the ride height by lifting up the entire car about 8-12 inches off the bench and drop it. After the suspension "settles" into place, raise or lower the shock collars as necessary until there is 21 mm gap from the bottom of the chassis to the ground.

### Anti-Squat:

Anti-squat denotes the angle of the rear arms relative to the ground. Zero anti-squat means that the rear arms are flat, parallel with the ground. The kit setting is 2 degrees, and can be reduced to 1 degree by removing the included #4 washer underneath the arm mount. You can add another #4 washer so that there is two washers underneath the arm mount to get 3 degrees of anti-squat. Adding anti-squat tends to make the car "rotate" more in corners, but doesn't handle as well through the bumps. 1 degree will be better in bumpy sections.

### Rear Camber Link Length & Washers under Ballstud:

Changing the length of the camber link is considered a bigger step than adjusting the ballstud height on the rear chassis brace. Typically shortening the camber link (or lowering the ballstud) will give the rear end less roll and the car will tend to accelerate or "square up" better. Lengthening the camber link (or raising the ballstud) will give the rear more roll and more cornering grip. To raise the ballstud, remove washers from in-between the ballstud and upper deck. You should normally use the kit setting and only adjust the ballstud height.

### Rear Hub Spacing:

You have 3 options for rear hub spacing, FORWARD, MIDDLE, & BACK. The kit setting is FORWARD, which provides the most rear traction and will be used most often. For improved handling in bumps or rhythm sections, try moving the hubs to MIDDLE or BACK. This can also make the car handle better in 180 turns.

### Anti-Roll Bar:

The #9780 B44 anti-roll bar kit (A.K.A. swaybar) allows you to add roll resistance to the rear end with minimal effect on handling over bumps and jumps. The anti-roll bar is very helpful when trying to tune the suspension. The black bar is the softest (.047" wire, standard) and the silver (.055" wire) is the hardest. It is popular to run a rear anti-roll bar in 4wd to help the car square up more out of turns. A front anti-roll bar can also be used, more specifically for higher grip tracks, where controlling weight transfer is more difficult. A front anti-roll bar helps keep the front flatter on corner entry, and helps prevent over loading the front outside tire as well as reduce the pitch of the car and maintain consistent grip on all tires. A rear anti-roll bar will help give the car more steering and square up quicker under acceleration.

## :: Tuning Tips (cont.)

### Rear Arm Hole:

The inner hole in the arm tends to work the best over the bumps and jump sections. Changing to the outer hole in the rear arm will tend to make the rear end feel more "locked in" and less responsive. Making this change to the outer hole requires you to remove the downtravel limiters from the rear shocks.

### Rear Ride Height:

The rear ride height setting you should use most often is 20 mm (the rear arms appear level when looking from the rear). Check the ride height by lifting up the entire car about 8-12 inches off the bench and drop it. After the suspension "settles" into place, raise or lower the shock collars as necessary until there is 20 mm gap from the bottom of the chassis to the ground. Note: Check the ride height gap at the rear end of the carbon fiber chassis, not at the rear chassis plate which is raised for more ground clearance. The chassis should look level from the side.

### Ackerman:

"Ackerman" refers to the relative angle difference between the front wheels as they are turned to steer the car. More ackerman means that there is a greater difference in angle between the wheels, and the less ackerman you have the closer the wheels steer parallel to each other. The ackerman on the B44.3 can be adjusted by moving the steering rack ballstud forwards or back on the steering rack.

The steering ballstud in the back position on the rack (More Ackerman) will make the car more forgiving to drive, particularly in looser conditions.

The steering ballstud in the forward position on the rack (Less Ackerman) will make the car twitchier around center but will have more steering mid to corner exit.

#### Steering Rack:

### Battery Placement:

The B44.3 battery cradle allows for quick battery spacing adjustment to fine tune the front to back weight distribution as needed. A simple rule of thumb to follow is, if your car pushes through the corner, shift the battery back & if it oversteers in the corner, move the battery forward.

### Weight Bias / Motor Orientation:

Running the saddle pack configuration positions the motor forward and overall has a more forward weight bias than the shorty battery configuration. The weight bias will vary depending on electronics and battery orientation.

Typically a more forward weight bias on higher grip surfaces and more rearward weight bias on lower grip surfaces.

### Gear Diff Tuning:

Center:

The center diff has the greatest influence in how the car accelerates and the feel of rear end grip. As the center diff is tuned with thicker oils it will differentiate less and begin to act more like a slipper or even a spool, and improve straight line acceleration. When using thinner center diff oils, the car can transfer power from either front or back more easily. Therefore when accelerating you transfer power to the front due to the weight transfer to the back.

As a result the rear end will usually be more stable and less likely to step out. Typically thicker fluids are used on higher traction surfaces and thinner on lower bite/ loose surfaces.

Front/ Rear:

When using thicker fluid the car will be less nimble rotating/ steering but it will be a little smoother putting down power in a straight line. The thinner oil will give the feeling more traction and have more steering but can 'walk' and have a little more instability under hard acceleration due to wheel spin on any corner of the car.

### Ball Differential (Option):

Adjust the differential [A.K.A. 'diff' for short] as noted in the assembly instructions. Adjusting the rear diff is not meant to be a tuning option. If you can hear the diff making a "barking" or "chirping" sound on jump landings or under acceleration, either your diff is set too loose or your slipper clutch is set too tight. The front diff can go out 1/16" turn to get more steering.

### Slipper Clutch (Option):

The assembly instructions give you a base setting for your clutch. To preserve the differentials, always start with the slipper on the loose side and slowly tighten the adjustment nut until it is set. To adjust the slipper, remove the body and insert a 2mm (or 5/64") hex wrench through the center of the top deck (or through the bottom slot in the chassis). Then, grab both of the rear wheels and rotate forwards to tighten and backwards to loosen. As you spin the wheels, you'll feel the motor click every 1/4 of a wheel revolution. At the track, tighten or loosen the nut in 2 click increments until you hear only a faint slipping sound for 1-2 feet on takeoffs.
